# Installation Guidelines

Thank you for purchasing your windows from Ultimate Windows.

Ultimate Windows fabricates very high quality, thermally efficient window systems. Therefore care must be taken when installing the windows to ensure optimal performance.

The following guidelines are offered for installation:

- Windows must be installed square and plumb to a deviation of no greater than 2mm over the course of the frame, this is particularly true for tilt and turn windows, as the high quantity of fittings must be working in unison for the window to function properly.
- Ensure that there is absolutely no torsion twisting of the frame when installing the window, as this can affect the operation of the sashes.
- Hardened plastic packing is highly recommended when installing the windows to avoid thermal expansion of the packing.
- We highly recommend using stainless steel or adequately coated steel screws to install the windows to ensure minute adjustment is possible to square the window frame.
- When installing hinged doors, where possible, fix the hinge side first and align the closing side jamb to suit the door to ensure smooth operation.

Any maintenance calls Ultimate Windows attends to where these guidelines are not followed will be at the builder's expense.

If there are any questions regarding installation, please call 0448 466 086.

Thank you again for using Ultimate Windows
